

INTERNAL REPORT: OPERATION FROST-BYTE

Document ID: FB-2026-X99

Classification: Top Secret - Level 4 Clearance Required

Project Overview

Operation Frost-Byte is an experimental initiative aimed at deploying sub-zero quantum computing modules in the Arctic Circle (Site B). The project is currently supervised by **Dr. Elena Vance** and is scheduled for a final launch on **October 12, 2026**.

Technical Specifications

The core hardware consists of the **Nebula-99 processor**, which requires a constant operating temperature of **-273.15 degrees Celsius**. The total budget allocated for the cooling infrastructure alone is **\$4.2 Million USD**.

Operational Safety Protocols

All personnel entering the Site B facility must undergo **Level 4 biometric iris scanning**. Access is restricted to the hours of 04:00 and 18:00 UTC due to solar radiation interference with the quantum entanglement stabilizers.

Documented Anomalies

During the stress test on January 15, engineers noted that the **secondary cooling fans exhibit a high-pitched rattle** whenever the system power draw exceeds **500kW**. This issue is currently under investigation by the hardware team.

Summary of Keywords for RAG Testing

- **Lead Scientist:** Dr. Elena Vance
- **Location:** Site B, Arctic Circle
- **Budget:** \$4.2 Million
- **Device:** Nebula-99 Processor
- **Critical Issue:** Fan rattle at 500kW
